                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as pacibutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence is encoded by the wheat Rht clone 5al genomic sequence.

                                                                                                                                                                                                                                                                                                                                              The specification describes polypeptides encoded by the Rht gene (and cits homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by globerellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with globerellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being globerellin insensitive. Taller plants wild-type, the dwarfing out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit globerellin blosynthesis, such as paclobutrazol, e.g. to allow use of a globerellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence is encoded by

                                                                                  The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by glbberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds the material and compared by the plant of the plants grow tall. The present sequence is encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               07-AUG-1998;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                     its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence is encoded by the partial sequence of the wheat rht-10 allele.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis;

                                                                                                                                                                                                                                                                                                                                                   plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence is encoded by rice expressed sequence tag (EST) AAD39460, which is homologous to the
                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 12; Fig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WO9909174-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oryza sativa.

This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence is encoded by the partial sequence of the maize D8-2023 allele.

                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the Arabidopsis thaliana gibberellin in sensitivity (gai-d2) gene product (GAI-d2), the expression of which inhibits plant growth. However the inhibition is antagonised by gibberellin (GA), while gai expression confers a dwarf phenotype that is insensitive to GA. Manipulating gai-d2 and GAI-d2 expression can produce tall or dwarf plants, particularly the latter for increased resistance to lodging and increased yield. It may also allow regulation of flowering, i.e. plants remain in the regettive state until treated with GA, useful to inhibit bolting in spinach and lettuce. GAI-d2 can be used to raise specific antibodies for identifying homologous proteins or genes in other species. gai-d2 fragments can also be used as probes or primers to identify and clone related sequences, or in the preparation of antisense or sense expression regulating (co-suppressing) sequences. Rice plants that express GAI-d2 may be resistant to Bakane disease. Manipulation of gai-d2 and GAI-d2 makes it possible to tailor the degree of dwarfism and GA sensitivity to particular crops
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     dwarf phenotype; lodging resistance; increased yield; flowering regulation; bolting inhibition; spinach; lettuce antibody; identification; probe; primer; antisense; sense; expression regulation; co-suppression; rice; Bakane disease resistance.

                                                                                                                                                                                                                                                                                                                                                                                                                                     transcription factors. SCR is expressed specifically in embryo root progenitor tissue and in certain root and stem tissues. It regulates a specific asymmetric division, and controls gravitropic response in aerial structures and root formation. SCR proteins (see ANW38178-201) from dicots and monocots, including SCR proteins lacking 1-4 of MOTIFS I-VI, and polypeptides corresponding to MOTIF I, II, III, IV, V or VI of SCR are claimed. Transgenic, plants can be engineered to overexpress the SCR protein, so that cell division is increased in roots, resulting in thicker root development, while a plant with an altered stem or hypocotyl gravitropism is less susceptible to lodging. Plants that contain an antisense molecule that suppresses the expression of endogenous SCR gene product have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of Arabidopsis SRPa2, a protein that shows homology to Arabidopsis SCARECROW (SCR) protein (see AAWA8178). SCR is a member of a novel protein family and contains number of functional domains similar to those found in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA encoding Arabidopsis SCARECROW protein - useful cell division and therefore alter root development, stem or hypocotyl gravitropism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      crop

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the amino acid sequence of Arabidopsis SRPa8, a protein that shows homology to Arabidopsis SCAREROROW (SCR) protein (see AAM38178). SCR is a member of a novel protein family and contains a number of functional domains similar to those found in transcription factors. SCR is expressed specifically in embryo root progenitor tissue and in certain root and stem tissues. It regulates a specific asymmetric division, and controls gravitropic response in aerial structures and root formation. SCR proteins (see AAM38178-201) from dicots and monocots, including SCR proteins (see AAM38178-201) from dicots and monocots, including SCR proteins (ase AAM38178-201) from dicots and monocots, including SCR proteins (see AAM38178-201) from dicots and monocots, including sCR proteins (ase AAM38178-201) from dicots and monocots, including sCR proteins (see AAM38178-201) from dicots and monocots, including sCR proteins (ase AAM38178-201) from dicots and monocots, while is increased in roots, resulting in thicker root development, while susceptible to lodging. Plants that contain an antisense molecule that suppresses the expression of endogenous SCR gene product have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 insensitivity (gai-d3) gene product (GAI-d3), the expression of which inhibits plant growth. However the inhibition is antagonised by gibberellin (GA), while gai expression confers a dwarf phenotype that is insensitive to GA. Manipulating gai-d3 and GAI-d3 cexpression can produce tall or dwarf plants, particularly the clatter for increased resistance to lodging and increased yield. It may also allow regulation of flowering, i.e. plants remain in the cyceptative state until treated with GA, useful to inhibit bolting in spinach and lettuce. GAI-d3 can be used to raise specific antibodies for identifying homologous proteins or genes in other species. gai-d3 fragments can also be used as probes or primers to identify and clone related sequences, or in the preparation of cantisense or sense expression regulating (co-suppressing) sequences. Rice plants that express GAI-d3 may be resistant to Bakane disease. Manipulation of gai-d3 and GAI-d3 makes it possible to tallor the degree of dwarfism and GA sensitivity to particular crops
                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is given in a specification relating to the Structure and function of a regulatory gene, SCARECROW (SCR).

SCARECROW-like (SCL) genes encoding proteins containing an amino acid sequence similar to the sequence of MOTIF III (VHIID) of Arabidopsis SCR protein are disclosed. SCR and SCL genes are useful for producing CC transgenic plants whose cell division is modified and root and/or stem CC development and gravitropism of stem or hypocotyl is altered. Cell division is increased or decreased in roots resulting in thicker or thinner root development. The transgenic plants are useful for expressing a gene of interest encoding a gene product that confers herbicide, salt, pathogen or insect resistance in root or embryos and genes encoding starch, lighin or cellulose biosynthesis in shoots. The SCR gene also CC confers less susceptibility to lodging in the transgenic plants than a wild-type plant. SCR gene sequences are also useful as molecular markers CC breeding of crop plants. 9. root or gravitropism trait in molecular CC breeding of crop plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  insensitivity (gai) gene product (GAI), the expression of which inhibits plant growth. However the inhibition is antagonised by gibberellin (GA), while gai expression confers a dwarf phenotype that is insensitive to GA. Manipulating gai and GAI expression can produce tall or dwarf plants, particularly the latter for increased resistance to lodging and increased yield. It may also allow regulation of flowering, i.e. plants remain in the vegetative state until treated with GA, useful to inhibit bolting in spinach and tettuce. GAI can be used to raise specific antibodies for identifying homologous proteins or genes in other species. gai fragments can also be used as probes or primers to identify and clone related sequences, or in the preparation of antisense or sense expression regulating (co-suppressing) sequences. Rice plants that express GAI may be resistant to Bakane disease. Manipulation of gai and GAI makes it possible to tailor the degree of dwarfism and GAI sensitivity to particular crops or situations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                         The patent relates to polynucleotides encoding 35 plant transcription of factors which may be used to modify phenotype associated with a plant's of guar sensing characteristics and increasing yield when their expression of level is altered. Sugars are central regulatory molecules that control of each of physiology, metabolism and development. Therefore the cDNAs of the invention are useful for modifying the growth and of germination rates of plants, photosynthesis, glyoxylate metabolism, of response, wounding response, cell cycle regulation, pathogen of response, wounding response, cell cycle regulation, pigmentation, of lowering and senescence of plants and for modifying sink-source of lowering and senescence of plants, and other storage organs leading of the invention factor polynucleotides and conjupeptides may be used to alter the structure and developmental of characteristics of plants such as soybean, wheat, corn, potato, cotton, crice, oliseed, sunflower, alfalfa, sugarcane, turf, banana, blackberry, confice, cucumber, egaplant, grapes, honey dew, lettuce, mango, melon, conion, papaya, peas, peppers, pineapple, spinach, squash, sweet corn, of the present sequence is an Arabidones fruits and/or vegetable brassicas.
